

SUPERPLANE

Token usage and billing

Track factory LLM spend. Give new organizations a welcome credit. Charge SuperPlane-hosted models after that credit is gone.

Phase 1 first

Anthropic · OpenAI · OpenRouter

Draft playbook

LOCKED

Three decisions

Org wallet

One Stripe customer and one credit balance per organization. Workspaces get optional budgets later.

Hosted spend only

SuperPlane bills its own keys. BYOK is reported. BYOK does not debit credit.

Three providers

Anthropic, OpenAI, and OpenRouter. Cursor and Bedrock are out of this program.

Reports roll up from work order to workspace to org from day one.

BUILD NOW

Phase 1 — Tracking and reporting

No Stripe. No wallet. No new provider product. Write the ledger first.

Do

Add usage events and a versioned price book. Record usage at the call site. Roll up into work-order cost columns. Add org, workspace, and per-model reports.

Do not

Reuse plan-limits Usage as the ledger. Scrape node payloads. Overload /settings/billing. Instrument Cursor, Bedrock, or canvas-sidebar chat.

Done when a text-prompt work order shows tokens and estimated USD.

LATER

Phases 2 to 6

- 2 Shared clients and model lists for the three providers.
- 3 Hosted catalog and welcome credit on org create.
- 4 BYOK model picker. Same ledger. Wallet untouched.
- 5 Stripe prepaid top-up. Hard stop when hosted balance is zero.
- 6 Workspace spend budgets and in-flight reservations.

Leave 2–6 as design until Phase 1 numbers look correct.

Assumptions

- **Grant once per org.** Not per user or workspace.
- **USD cents** are the billing source of truth.
- **Plan-limits Usage** stays a separate service.
- **Execution cost columns** are caches. The ledger is source of truth.
- **Record at the call site.** Do not scrape payloads.
- **Current integrations are BYOK** until hosted keys exist.
- **Self-hosted gets tracking** only. No credit. No Stripe.
- **Stripe v1 is prepaid top-up**, not metered invoices.
- **Canvas sidebar chat** stays on the external Usage service.
- **Cursor and Bedrock** stay out of catalog and picker.

Questions

1. **Welcome amount.** How much USD does a new org receive?
2. **Display unit.** Tokens, USD, or both for remaining credit?
3. **Default hosted provider.** OpenRouter, Anthropic, or OpenAI?
4. **Markup.** Pass through cost, or add a SuperPlane margin?
5. **Hard stop.** Wait for Stripe, or stop when credit is zero?
6. **Workspace model subset.** In Phase 4, or only with budgets?
7. **Ledger retention.** How long do we keep usage events?
8. **Rename /settings/billing.** That page is plan limits.
9. **Compute.** When do runner minutes join the same reports?
10. **Tax and invoicing entity.** Legal work for Stripe. Not schema work now.

NEXT

First slice

Implement Phase 1 only. Keep the PRD as the source of truth.

Ledger

usage_events, price book, RecordUsage, tests.

Instrument

Factory-linked Claude, OpenAI, and Perplexity nodes that already return usage.

Report

Org, workspace, work order, and per-model spend. Thin UI.
